

- To import the romenext project into eclipse
 - Go to File -> Import. When the window open, select Maven -> Existing Maven Projects and click Next

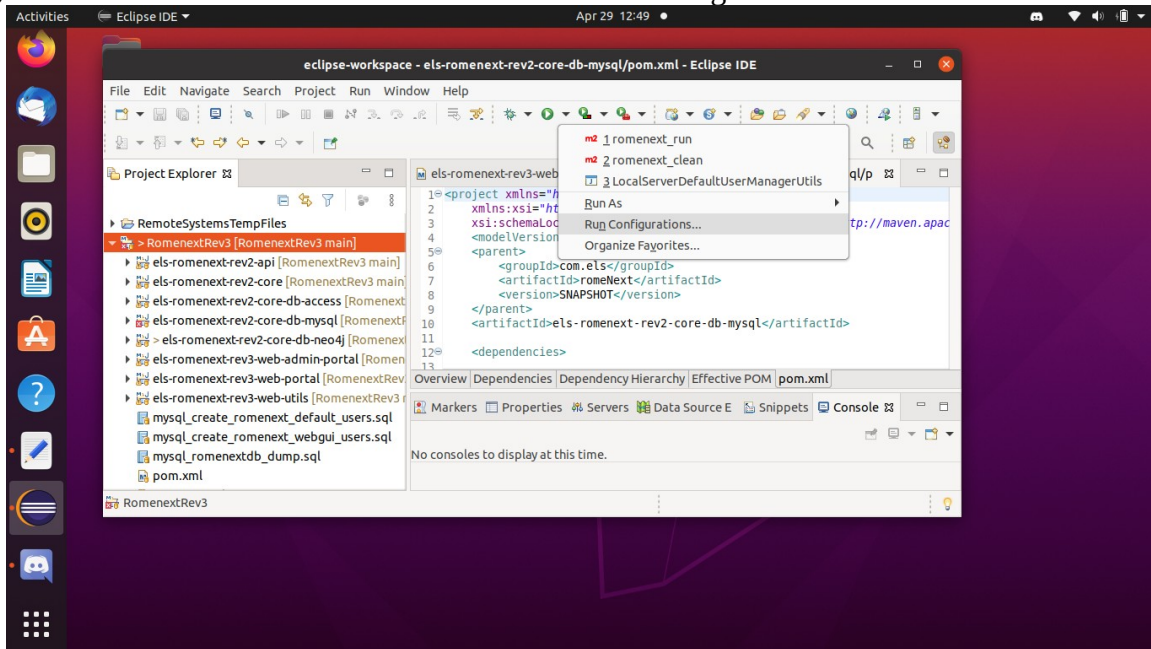

- Browse to the directory of the romenext project and click Finish. Wait until the import process finish (when you see there is no progress bar moving in the right bottom corner)

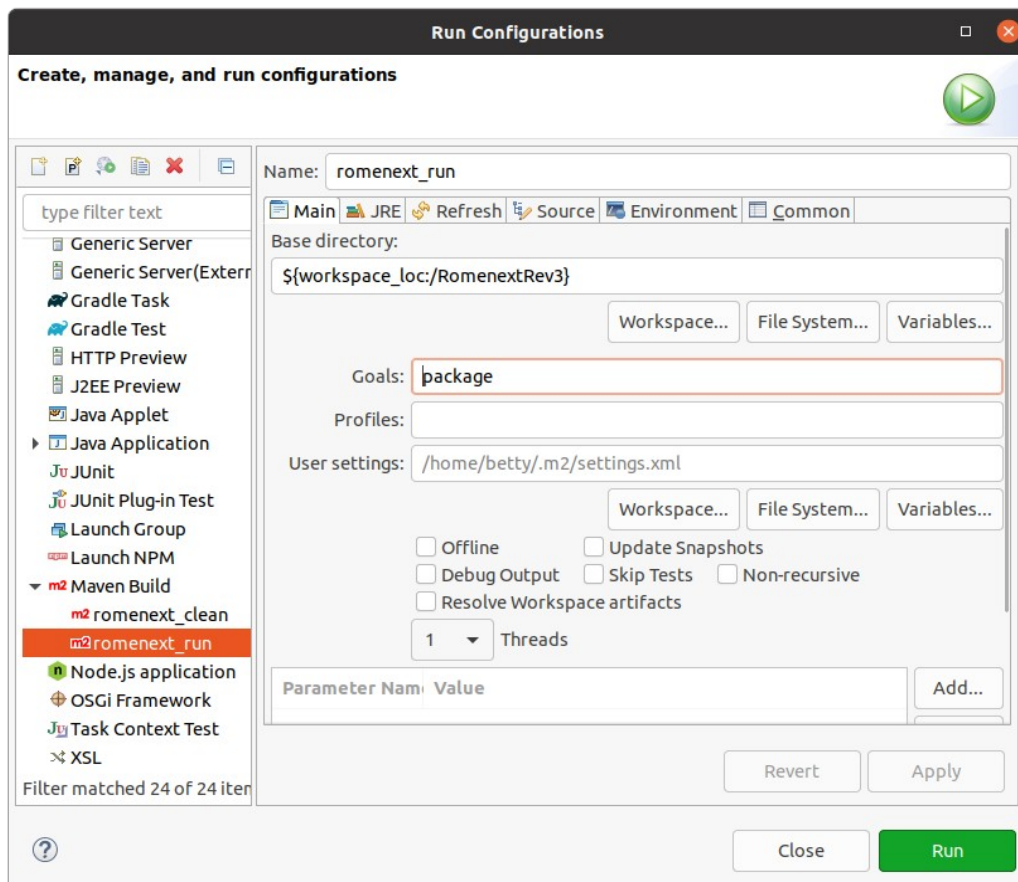

- Make sure the JRE System Library is using Java 1.8 or up for each sub project

- To build the three war files

1) Click the selection button in run and select “Run Configurations”

2) Fill in the Run Configurations according to the screenshot below (The phrase “package” in Goals means that we want to package the source code into war (or jar) files. This is a good reference for maven goals: <https://www.baeldung.com/maven-goals-phases>)

3) Click Run or click romenext_run. The war files can be built. The screenshot shows the message when the war files are successfully built.
